skinix products can help in many ways.

These products offer really high levels of comfort and functionality, and are easy to use.
We developed them based on surveys of people working in clinical settings, so they combine our technologies and expertise, to help you provide the best care possible.

Tape basically consists of a film layer and an adhesive, which is cut into various shapes.

By optimizing these features and the overall product, we have greatly improved on the properties of our products. We have also explored specific shapes and processes that are effective over a wide range of applications.

Developing the ideal film

We developed a unique film with high-grade features, including ZERO feel[1] ultrathin film and a cushion dressing that effectively reduces pressure.

The ideal adhesive

We have explored the properties of adhesive gel to create new functions that do not rely just on the power of adhesives.

The ideal shape

We offer various unique products especially designed to be effective no matter who uses them.

Tape products should be selected based on the actual situation in front of you.

Before a wound forms

These products reduce various threats to the skin, including the possibility of wounds caused by medical instruments, skin tears caused by tape, and bedsores.

COCOROLL

This thin, highly elastic cushion dressing safeguards skin against the chafing and pressure if it comes into contact with medical instruments.

Nanotear-Fit

We have explored the properties of gels, which has led to an evolution in tapes. This tape can be removed with a minimum of chafing or damage to sensitive skin.

CLEAR HOLD

This transparent, ultrathin tape is for securing transnasal tubes, and improves patient comfort. The special shape allows anyone on staff to apply or remove it.

AIRWALL fuwari

AIRWALL fuwari includes ZERO Feel[1]—so you will forget it is there. This is a transparent, ultrathin, and waterproof film dressing, and secures skin and wound.

For wounds

If a wound develops, our products cover the wound and safeguard it against threats like external irritation and infection.

AIRWALL fuwari pad

AIRWALL fuwari pad is a sterile film dressing with pad, and can be applied directly to the wound.

AIRWALL IV

AIRWALL IV is a sterile film that protects the wound surface. It is a soft film that firmly sticks to the skin and protects the wound, but avoids causing a damp or sweaty feel.

AIRWALL fuwari

AIRWALL fuwari includes ZERO Feel[1], so you will forget it is there. This is a transparent, ultrathin, and waterproof film dressing, and secures skin and wound.

Scar[2] care

These protective products help to minimize any scarring. They also safeguard sensitive skin against various irritants.

ATLESS-CARE

ATLESS-CARE is special tape designed for scar[2] care after sutures have been removed. As tape is stretched, it holds healed wounds closed, due to the restorative force of the stretched tape, and prevents them reopening.

AIRWALL UV

This is a transparent and ultrathin dressing film, and blocks about 97%[3] of UV, so it safeguards skin from UV and other damage.

Products for securing instruments and gauze

We have products with various functions, materials, and shapes, depending on the actual type and use of instruments and skin conditions. They are used to fix items securely to the skin, but with minimal damage to the skin.

AIRWALL IV

This IV fixing film is used to secure IV needles, and the soft film bonds tightly to skin to support the needle but does not cause dampness or discomfort.

CLEAR HOLD

This transparent, ultrathin tape is for securing transnasal tubes, and improves patient comfort. The special shape allows anyone on staff to apply or remove it.

AIRWALL fuwari

ZERO Feel[1]—so you will forget it is there. This is a transparent, ultrathin, and waterproof film dressing, and secures skin and wound.

Nanotear-Fit

We have explored the properties of gels, which has led to an evolution in tapes. This tape can be removed from the skin with a minimum of chafing or damage to sensitive skin.

1 ZERO Feel: With ZERO Feel, patients will almost forget the tape is there.
(The perceived performance may differ from individual to individual.)
2 Scar: This refers to the condition in which the wound surface is closed, and is free of exudate or bleeding.
3 About 97%: Based on data gathered by Kyowa
